

GTM & BUSINESS STRATEGY

Millet Ready-to-Cook Breakfast Kit

Kharghar Pilot | 90-Day Go-to-Market & Scale Strategy

CASE STUDY REPORT

Name	Lokendra Joshi
Roll No.	150096725062
Cohort	Larry Page
Course	B.Tech CSE
Institution	ITM Skills University

Semester III • Sprint I

Executive Summary

The proposed business targets breakfast-preparation friction among college students in Kharghar PGs, with young working professionals as a secondary segment. The strategy is **convenience-led**, offering a ready-to-cook millet breakfast that reduces shopping, measuring, preparation and cleanup.

The launch product is a **Millet Upma Kit at ₹149 for five servings**. With ₹82 assembly and packaging cost, this gives **₹67 contribution per kit (~45%) before other costs**. At 1,500 kits/month, revenue is ₹223,500 and contribution is ₹100,500—not net profit.

GTM will use **experiential sampling + Breakfast Week bundles**, with PG bulk orders and pickup points prioritized to improve distribution economics. Individual delivery is selective, while quick-commerce remains a future option.

The first 90 days will validate **taste, convenience, willingness to pay, repeat purchase, CAC, demand density, delivery economics and operational consistency** before scaling.

MANAGEMENT THESIS

Build a hyperlocal convenience-breakfast business first—not a broad millet brand. Win a dense PG/community cluster with one hero SKU, prove repeat purchase and contribution after relevant variable costs, then expand.

Known Case Facts vs. Pilot Hypotheses

Known case facts	Working hypotheses / targets to validate
₹149 selling price per kit	Kharghar is an appropriate pilot geography
5 servings per kit	College students in PGs are the strongest beachhead segment
₹82 assembly + packaging cost per kit	Preparation can be ≤10 minutes
1,500 kits/month initial capacity	1–2 utensils are sufficient
Farmer group produces millet, pulses and spices	45–60 day shelf-life target is achievable
	2–4 purchases per customer per month
	₹149 willingness to pay, CAC, repeat rate and delivery cost

The report intentionally uses “proposed,” “target,” “hypothesis,” and “to be validated” for claims that have not yet been tested.

1. Market Problem & Opportunity

The core problem is **breakfast friction**. For students and young professionals with hectic mornings, self-preparing breakfast involves planning, buying and storing ingredients, measuring, cooking and cleaning. The challenge is therefore the **total effort around breakfast**, not just cooking time.

The kit competes with **PG mess, outside food, self-cooking, instant foods and skipping breakfast**. It aims to combine **instant-food convenience with the control and self-prepared experience of cooking**, while reducing the usual preparation and cleanup effort.

Alternative	Convenience	Self-prepared	Ingredient control	Preparation effort
PG mess	High	Low	Low	Very low
Outside breakfast	High	Low	Low / variable	Very low
Self-cooking	Low	High	High	High
Instant packaged food	High	Low / medium	Medium	Very low
Proposed kit	High	High	High / medium	Low

Customer Job-to-be-Done

CORE JOB

“Help me have a decent breakfast quickly without the usual planning, shopping, measuring, preparation and cleaning involved in self-cooking.”

2. Customer & Positioning

Dimension	Primary beachhead	Secondary segment
Customer	College students living in PGs	Young working professionals in PG/co-living
Geography	Kharghar pilot	Kharghar pilot
Core friction	Hectic / irregular mornings and low willingness for elaborate preparation	Time-constrained mornings and preference for predictable convenience
Purchase logic	Convenience + affordability + familiar taste	Convenience + predictable routine + willingness to pay
Community potential	High potential for roommate / PG bulk orders	Potential for co-living / community orders

Kharghar is proposed as the pilot geography due to its concentration of **educational institutions, residential areas and young consumers**, which may support a dense hyperlocal customer base. The first 30 days will validate **PG density, customer concentration and distribution access** before wider expansion.

Value Proposition Hierarchy

Priority	Value proposition	Strategic role
1	Convenience	Primary purchase driver
2	No measuring / preparation hassle	Removes friction from self-cooking
3	Time saving	Target ≤10 minutes; subject to testing
4	Taste	Critical to repeat purchase
5	Affordability	Supports routine use

Priority	Value proposition	Strategic role
6	Local / traditional positioning	Supporting differentiation
7	Health / nutrition	Supporting benefit, not central promise
8	Farmer sourcing	Supporting trust / provenance story

POSITIONING

For busy PG residents who want a convenient but self-prepared breakfast, the Millet Upma Ready-to-Cook Kit provides a familiar breakfast with minimal planning, preparation and cleanup.

3. Product & Offer Strategy

Specification	Launch design
Hero SKU	Millet Upma Ready-to-Cook Breakfast Kit
Serving format	5 servings per kit
Price	₹149 per kit
Working preparation target	≤10 minutes; to be validated
Utensils	Approximately 1–2; to be validated
Experience	Open → add water → cook → eat → minimal cleanup
Launch principle	One hero SKU; optimize learning before SKU breadth
Future SKU	Millet Poha-style Breakfast Kit, only after evidence

The product should deliver the convenience associated with instant food while retaining a self-prepared breakfast experience. The initial offer should avoid broad SKU expansion because a single product simplifies production, messaging, sampling, inventory and feedback.

Offer Architecture

Offer	Purpose
Single Kit — ₹149	Low-friction first purchase and individual use
Multi-Kit Bundle	Stock-up and improved order economics
Breakfast Week Challenge	Convert first trial into repeated usage through a multi-kit bundle
Future 15–20 day stock-up	Potential recurring / higher-value offer; subject to pilot evidence

The Breakfast Week offer should contain enough servings/kits for the intended challenge. The report does not assume that one five-serving kit equals one week.

4. Customer Journey & Go-to-Market

Stage	Customer experience	Business objective
1. Awareness	PG, college, office-event and community exposure	Generate qualified trial

Stage	Customer experience	Business objective
2. Discovery / Trial	Taste product and observe preparation	Demonstrate convenience, speed and taste
3. First purchase	₹149 single kit / introductory offer if required	Convert trial
4. Breakfast Week	Multi-kit bundle	Create routine
5. Repeat	Single kit, bundle or stock-up	Build retention
6. Community purchase	Roommates / PG residents consolidate orders	Increase order density
7. Referral	Reorder and recommend	Lower acquisition friction

Acquisition Mechanism A — Experiential Sampling

Sampling should be treated as a product demonstration, not simply a free-food activity. The experience should prove taste, preparation simplicity, speed, cleanup and perceived value.

- Flow: Sample → explain preparation → demonstrate → collect feedback → first-purchase offer → purchase.
- Track: sample-to-purchase conversion, taste satisfaction, preparation time, objections, willingness to pay and first-to-second purchase.

Acquisition Mechanism B — Breakfast Week Challenge

The Breakfast Week bundle is designed to move the customer from one-time curiosity to repeated usage. Its commercial purpose is retention: establish a usage pattern, collect feedback and observe whether the customer returns after the initial bundle.

GTM PRINCIPLE

Optimize profitable order density, not simply total orders. Ten customers concentrated in one PG can be strategically more valuable than ten customers dispersed across the city.

5. Distribution, Operations & Supply Chain

Channel	Role	Economic logic / condition
PG / community bulk orders	Primary	Consolidates demand and can reduce delivery friction
Pickup points / kiosks	Secondary	Useful where local demand can be aggregated
Individual local delivery	Tertiary	Use selectively when pickup / bulk ordering is unavailable
Quick-commerce	Future / fallback	Explore only if listing, commercial terms and economics are viable

The pilot has access to a family-operated pickup/store setup. There is no incremental salaried staff cost during the pilot because family members operate the pickup point; however, family labor has an economic opportunity cost and should be tracked separately if the model scales.

Supply Chain Flow

OPERATING FLOW

Farmer groups → raw-material collection → quality inspection → cleaning / processing → ingredient preparation → proportioning / mixing → kit assembly → packaging & labelling → finished-goods storage → PG bulk / pickup / delivery → consumption → feedback → repeat / improvement

Quality & Shelf-Life

A 45–60 day shelf-life target may be commercially useful, but the final shelf life must be established through appropriate product, packaging, storage and food-safety validation. Quality control should cover raw materials, processing, proportioning, packaging integrity, storage conditions and finished-product consistency.

6. Business Model & Economics

Metric	Case value	Interpretation
Selling price / kit	₹149	Known case input
Servings / kit	5	₹29.80 per serving
Assembly + packaging / kit	₹82	Known case input
Contribution / kit	₹67	Before other operating costs
Contribution margin	≈45%	Before other operating costs
Initial capacity	1,500 kits/month	Known case input

Full-Capacity Monthly Economics

Calculation	Result
Revenue: $1,500 \times ₹149$	₹223,500
Assembly + packaging: $1,500 \times ₹82$	₹123,000
Contribution before other costs	₹100,500

FINANCIAL LANGUAGE

₹67 per kit and ₹100,500 at full stated capacity are contribution figures, not net profit. Relevant additional costs include logistics, sampling, discounts, marketing, payment fees, wastage, storage, pickup operations and overhead.

Illustrative Delivery Scenario

Scenario	Per-kit calculation	Remaining contribution
Individual order with illustrative ₹30 delivery	$₹149 - ₹82 - ₹30$	₹37

₹30 is an illustrative scenario, not a known market delivery cost. The implication is that demand concentration and consolidated delivery are strategically important.

7. Business Model Canvas

Block	Pilot model
Customer Segments	College students in PGs; young working professionals in PG/co-living
Value Proposition	Ready-to-cook millet breakfast; minimal preparation; no measuring; less shopping/cleanup; familiar taste; affordable five-serving format
Channels	PG/community sampling; colleges; office events; pickup points; local ordering; individual delivery; potential future quick-commerce
Customer Relationships	Experiential sampling; trial offer; Breakfast Week; community ordering; repeat purchase; referral
Revenue Streams	₹149 single kit; multi-kit bundles; Breakfast Week bundles; future recurring/group orders
Key Resources	Farmer network; formulation; production capability; packaging; brand; distribution network; customer data
Key Activities	Procurement; production; QC; packaging; sampling; acquisition; distribution; feedback / iteration
Key Partners	Farmer groups; processing/packaging partners; PG/community partners; college/event partners; delivery partners; potential platforms
Cost Structure	Assembly + packaging; raw materials if not included; delivery; sampling; marketing; discounts; payment fees; storage; wastage; pickup operations; overhead

8. SWOT, Risks & Defensibility

Strengths	Weaknesses
Convenience-led proposition; pre-portioned ingredients; low preparation effort; five-serving pack; farmer sourcing story; hyperlocal pilot; community distribution potential	Unproven brand; taste not yet validated; limited initial range; ₹149 may face price comparison; individual delivery can reduce contribution; limited initial capacity; differentiation can be copied
Opportunities	Threats
PG recurring orders; college partnerships; corporate sampling; pickup network; stock-up bundles; subscriptions; variants; geographic expansion; broader millet/pulse products	Outside breakfast; PG mess; instant packaged food; FMCG competitors; copycats; raw-material volatility; low repeat; taste dissatisfaction; shelf-life/food-safety issues; distribution costs; platform dependency

Key Risk Matrix

Risk	Potential effect	Primary mitigation	Evidence to monitor
Taste not good enough	Low repeat	Controlled taste testing + formulation iteration	Taste satisfaction; first-to-second purchase
₹149 feels expensive	Low conversion	Communicate five-serving value; test bundles	Conversion; willingness to pay

Risk	Potential effect	Primary mitigation	Evidence to monitor
Delivery destroys economics	Low contribution	PG bulk; pickup; consolidated delivery	Delivery cost/order; contribution/order
Trial does not become repeat	Weak retention	Breakfast Week; usage tracking; product improvement	Repeat rate; purchase frequency
Shelf-life / quality issue	Wastage / trust risk	Packaging, storage and food-safety validation	Complaints; wastage; validated shelf life
Copcats	Differentiation pressure	PG network; procurement; brand; learning; operations	Repeat; community density; sourcing efficiency
Too many SKUs	Complexity / inventory	One hero SKU until evidence	SKU-level contribution and repeat

DEFENSIBILITY

There is no strong technology moat at launch. Early defensibility should come from execution: dense PG/community relationships, recurring customers, sourcing relationships, procurement efficiency, product learning, customer data, local trust and operational discipline.

9. 90-Day Pilot-to-Scale Plan

Phase	Objective	Core actions	Primary metrics / decision evidence
Days 1–30 VALIDATE	Validate product, taste, preparation, willingness to pay and geography	Finalize upma prototype; taste tests; timed preparation tests; utensil test; packaging test; shelf-life pathway; PG mapping; sampling; ₹149 test	Samples; sample-to-purchase; taste satisfaction; preparation time; willingness to pay; first purchase; complaints; wastage
Days 31–60 CONTROLLED PILOT	Establish repeat, PG distribution and delivery economics	Select high-potential PGs; Breakfast Week; pickup point; PG bulk orders; referral test; local delivery; college/office sampling	CAC; first-to-second purchase; kits/customer; AOV; PG conversion; bulk-order share; delivery cost/order; contribution/order; repeat frequency
Days 61–90 SCALE DECISION	Concentrate on winning clusters and refine economics	Improve formulation; optimize bundles; strengthen pickup; increase community ordering; evaluate second SKU; assess quick-commerce feasibility	Repeat; order density; contribution after relevant variable costs; operational consistency; validated shelf life; inventory control

Pilot KPI Framework

KPI group	Measures
Product	Preparation time; taste satisfaction; complaint rate; wastage; packaging damage
Acquisition	Samples; sample-to-purchase conversion; CAC; source-level conversion

KPI group	Measures
Customer	First-to-second purchase; purchases/customer/month; repeat rate; bundle adoption; referral rate
Distribution	Orders/PG; kits/order; delivery cost/order; delivery distance; pickup utilization; bulk-order share
Financial	Revenue; contribution/kit; contribution/order; variable cost/order; discount rate; marketing spend; net contribution after relevant variable costs

10. Scale Decision & Final GTM Thesis

At Day 90, management should assess five dimensions: product-market fit, commercial fit, distribution fit, operational fit and economic fit. Calendar time alone should not trigger expansion.

Scale gate	Evidence required before broader expansion
Product	Strong taste acceptance; reliable preparation; low complaint rate
Customer	Repeat purchase; sufficient frequency; willingness to pay
Distribution	Meaningful PG density; concentrated demand; manageable delivery economics
Economics	Positive contribution after relevant variable costs
Operations	Consistent quality; validated shelf life; scalable production without quality degradation

FINAL GTM THESIS

Treat the business initially as a hyperlocal convenience-breakfast business, not a broad “millet brand.” Start with Kharghar, one hero product, convenience-first positioning, experiential sampling, Breakfast Week conversion, PG/community bulk ordering and selective pickup/delivery. Scale only after repeat purchase, willingness to pay, CAC, order density, delivery economics and operational reliability are demonstrated.

Appendix A — Key Assumptions

Assumption	Status	Validation method
≤10-minute preparation	Hypothesis / target	Timed product test
1–2 utensils	Hypothesis / target	User test
45–60 day shelf life	Target pending validation	Food / packaging / storage validation
2–4 purchases/month	Hypothesis	Repeat-purchase tracking
Kharghar PG density	Hypothesis	Field mapping
₹149 willingness to pay	Hypothesis	Purchase / conversion testing
CAC	Unknown	Channel-level pilot measurement

Assumption	Status	Validation method
Delivery cost	Unknown	Actual pilot order tracking
Quick-commerce feasibility	Unknown	Platform and commercial assessment

Appendix B – Operating Responsibility Map

Activity	Primary responsibility
Farmer sourcing / raw materials	Procurement
Quality inspection	Production / Quality
Cleaning, processing, preparation	Production
Proportioning / assembly / packaging	Production
Inventory	Operations
PG acquisition / PG orders	Sales / Community + Operations
Pickup point	Family-operated pilot
Delivery	Delivery / Logistics
Customer feedback	Marketing / Customer Operations
Product iteration	Product / Production

END OF REPORT
