

# Launching the Millet Kit

A READY-TO-COOK BREAKFAST FOR BUSY PG RESIDENTS • KHARGHAR PILOT

Product: Millet Upma Ready-to-Cook Kit | Business Type: Hyperlocal convenience-breakfast

## 1 Product Idea case facts + proposal

### Product name

Millet Upma Ready-to-Cook Breakfast Kit HERO SKU

### What it offers

A pre-portioned kit built on **millet, pulses and spices** from a farmer group. Instead of shopping, measuring and prepping, the customer follows a simple flow: **open packet** → **add water** → **cook** → **eat**. It aims to deliver the convenience of instant food while keeping the feel of a **self-prepared** breakfast.

### What is inside the proposition

### What problem does it solve?

Self-cooked breakfast demands **eight small jobs** before the first bite: deciding, buying, storing, measuring, prepping, cooking, using many utensils and cleaning. In a rushed morning this creates time pressure, effort and decision fatigue, so people skip breakfast or fall back on outside food, instant noodles or the PG mess.

The kit tackles **breakfast friction**, not hunger alone, by collapsing those jobs into **one pre-portioned pack**.

## 2 Target Customer pilot hypothesis

### Who will buy / use the kit?

Customers who feel **breakfast-preparation friction** on busy mornings. Having a kitchen, a shared kitchen or mess access does not exclude them.

### Primary (beachhead)

College students living in PGs, Kharghar

### Secondary

Young working professionals in PG / co-living

### Why Kharghar? VALIDATE IN FIRST 30 DAYS

- Educational institutions nearby
- Residential concentration, PG clusters
- Students and young professionals
- Potential for dense, hyperlocal delivery

PG density, access and willingness to pay are not yet verified.

Student persona (approx. 18–25 yrs): “Give me breakfast quickly without making me shop, measure, prepare and clean.”

The pilot targets breakfast friction, not the absence of a kitchen, and starts hyperlocally in Kharghar.

3

Positioning & Value

strategic hypothesis

Customer job-to-be-done

“Help me have a decent breakfast quickly, without the planning, shopping, measuring, preparation and cleaning of self-cooking.”

Value hierarchy

PRIORITY ORDER

- 1
- Convenience
- 2
- No measuring / prep hassle
- 3
- Time saving (≤10 min target)
- 4
- Taste (critical for repeat)
- 5
- Affordability
- 6
- Local / traditional
- 7
- Health / nutrition
- 8
- Farmer story

Where the kit sits among real alternatives

| Alternative           | Convenience | Self-prepared     | Ingredient control  | Prep effort (lower is better) |
|-----------------------|-------------|-------------------|---------------------|-------------------------------|
| PG mess               | ●●●● High   | ●○○○ Low          | ●○○○ Low            | ●○○○ Very low                 |
| Outside breakfast     | ●●●● High   | ●○○○ Low          | ●○○○ Low / variable | ●○○○ Very low                 |
| Self-cooking          | ●○○○ Low    | ●●●● High         | ●●●● High           | ●●●● High                     |
| Instant packaged food | ●●●● High   | ●●○○ Low / medium | ●●○○ Medium         | ●○○○ Very low                 |
| Millet kit (proposed) | ●●●● High   | ●●●● High         | ●●●○ High / medium  | ●●○○ Low                      |

Directional strategic comparison, not market research. Dots show relative level; the label is the source rating.

For busy PG residents who want a convenient but self-prepared breakfast, the kit offers a familiar meal with minimal planning, prep and cleanup.

4

Customer Journey & Acquisition

A · Experiential Sampling

Sample · Explain · Demo · Feedback · Offer

- Where: PGs, colleges, corporate / office events
- Show taste, simplicity, speed, easy cleanup, value
- Track sample-to-purchase, taste score, prep time, objections

B · Breakfast Week Challenge

Trial · Bundle · Daily use · Feedback · Repeat

- Purpose: turn first trial into a routine
- A multi-kit bundle sized to the challenge; one 5-serving kit is not claimed to cover a week
- Track bundle adoption and first-to-second purchase

Mess dependence

Gains the kit targets

Faster breakfast

Less mental effort

Fewer utensils

Familiar taste

Stock-up ease

Affordable routine

## 5 Distribution & Operations

channel + ops plan

Channel priority: concentrate demand before spreading it

PRIMARY

### PG / Community Bulk Orders

primary

- Sample at a PG → ~20 interested residents → **one consolidated order** → one drop or pickup
- Improves order density, delivery cost and acquisition efficiency

SECONDARY

### Small Pickup Points / Partner Points

pilot access

- Family-operated pickup setup: **no incremental salaried staff cost** in the pilot
- Family labour still has an opportunity cost: track separately before scaling
- No standalone retail shop before demand is validated

TERTIARY

### Individual Local Delivery

selective

- Use when demand is dispersed, bulk is unavailable or pickup is inconvenient
- Monitor contribution per order closely

FUTURE / FALLBACK

### Quick Commerce

not assumed

- Blinkit, Zepto or similar for dispersed demand
- Subject to listing feasibility, commercial terms and unit economics

Core principle: optimise profitable order density, not just total orders

#### A • Concentrated demand

✓ lower cost to serve

#### B • Dispersed demand

× higher cost to serve

Supply chain: farmer group to feedback loop

## 6 Business Model & Economics case facts + illustration

₹ **₹149**  
Selling price / kit  
case fact

५१ **5**  
Servings per kit  
case fact

₹ **₹82**  
Assembly + packaging  
per kit · case fact

📈 **1,500**  
Initial capacity  
kits / month · case fact

### Unit & full-capacity economics

#### Per kit: where the ₹149 goes case facts

|                                                | ₹82 assembly + packaging | ₹67 contribution |
|------------------------------------------------|--------------------------|------------------|
| ₹0                                             | ₹82                      | ₹149             |
| Selling price / kit                            |                          | ₹149             |
| Less: assembly + packaging / kit               |                          | - ₹82            |
| <b>Contribution / kit (before other costs)</b> |                          | <b>₹67</b>       |
| Contribution margin (before other costs)       |                          | ~45%             |
| Price per serving (₹149 ÷ 5)                   |                          | ₹29.80           |

#### Full capacity: 1,500 kits / month arithmetic

|                                                                                            |                 |
|--------------------------------------------------------------------------------------------|-----------------|
| Revenue (1,500 × ₹149)                                                                     | <b>₹223,500</b> |
| Assembly + packaging (1,500 × ₹82)                                                         | <b>₹123,000</b> |
| Contribution before other operating costs                                                  | <b>₹100,500</b> |
| Shown as contribution, <b>not profit</b> : other operating costs are still to be deducted. |                 |

### Scale of contribution and the delivery question

#### Monthly contribution by capacity use before other costs

Straight arithmetic at ₹67/kit. Actual volumes are a pilot outcome, not a forecast.

The ₹67 contribution is before other operating costs and should not be read as net profit.

#### Revenue streams

- ₹149 single kit
- Multi-kit bundles (stock-up)
- Breakfast Week bundle (multi-kit, price to be tested)
- Future recurring / group orders

#### Why delivery decides the economics

ILLUSTRATIVE SCENARIO, NOT A KNOWN COST

■ ₹82 assembly + packaging   ■ delivery cost (illustrative ₹30 / drop)   ■ remaining contribution

##### No delivery cost (reference)

₹149 - ₹82

82

67

**₹67**  
per kit

##### Single-kit home delivery

₹149 - ₹82 - ₹30

82

30

37

**₹37**  
per kit

##### PG bulk drop, 20 kits in one trip

₹30 ÷ 20 = ₹1.50 per kit

82

65.50

**₹65.50**  
per kit

All figures still sit **before** marketing, sampling, discounts, payment fees, wastage and overhead. The ₹30 is an assumption to be replaced by pilot data.

### Cost drivers still to be captured

#### Product & supply

Raw materials, if not in ₹82   Wastage  
Storage   Utilities

#### Go-to-market

Sampling   Marketing  
Discounts / intro offers   Payment fees

#### Delivery & overhead

Delivery   Pickup operations  
Admin / overhead  
Family labour (track separately)

### Economic watch-outs

#### Delivery erosion

Single-kit drops can consume much of the ₹67.

#### Discount leakage

Intro offers and bundles cut contribution per kit.

#### Weak repeat

Low repeat leaves acquisition cost un-recovered.

#### Input volatility

Raw-material prices may move if not inside ₹82.

## 7 Business Model Canvas 9 blocks

## 8 Moat & Execution Flywheel strategic hypothesis

Five questions a reader should be able to answer

## 9 SWOT & Risk strategic view

### Strengths

internal

- Clear convenience proposition
- Relevant to busy PG residents
- Pre-portioned ingredients
- Low preparation effort
- Minimal utensil requirement
- Five-serving pack
- Farmer sourcing story
- Hyperlocal pilot
- Community distribution opportunity

### Weaknesses

internal

- Unproven brand
- Taste not yet validated
- Limited initial product range
- ₹149 may face price comparison
- Individual delivery can damage contribution
- Initial capacity limited
- Differentiation can be copied

### Opportunities

external

- PG recurring orders
- College partnerships
- Corporate breakfast sampling
- Pickup network
- Stock-up bundles & subscriptions
- Product variants
- Geographic expansion
- More millet / pulse products
- Farmer-to-consumer brand

### Threats

external

- Outside breakfast
- PG mess
- Instant packaged food
- FMCG competitors
- Local copycats
- Raw-material volatility
- Low repeat
- Taste dissatisfaction
- Shelf-life / food-safety issues
- Distribution costs
- Platform dependency

### Key risks, placement and mitigation

#### Risk matrix

qualitative, to be validated

|          |     |              |      |
|----------|-----|--------------|------|
| IMPACT ↑ | 5   | 4            | 1 3  |
|          |     | 2            | 8    |
|          | 7   | 6            |      |
|          | LOW | LIKELIHOOD → | HIGH |

Placement is judgement for prioritising pilot attention, not measured probability.

Top attention in the pilot: **taste (1), delivery (3) and repeat (4)** decide whether the model works.

#### Reading the grid

Numbers match the risk cards below. Darker cells need an owner and a trigger metric from Day 1.

#### 1 Taste is not good enough

- Controlled taste tests   Structured feedback   Formulation iteration
- Repeat measurement

KPI: taste satisfaction, first-to-second purchase

#### 2 ₹149 feels expensive

- Communicate 5-serving value   Communicate convenience
- Test single vs bundle pricing   Don't compete on price alone

KPI: conversion at ₹149

#### 3 Delivery destroys economics

- PG bulk   Pickup points   Consolidated delivery   Cluster acquisition

KPI: delivery cost / order

#### 4 Trial does not become repeat

- Breakfast Week bundle   Taste improvement   Usage tracking
- Second-purchase feedback

KPI: purchase frequency

#### 5 Shelf-life / quality problems

- Packaging validation   Moisture control   Storage testing
- Food-safety testing   Documented shelf life

KPI: complaints, damage

#### 6 Copycats

- PG network   Customer relationships   Procurement   Brand
- Product learning   Operations

#### 7 Too many SKUs too early

- One hero SKU; add the second only after evidence

#### 8 Insufficient demand concentration

- Map PG clusters   Prioritise high-density zones   Pickup points
- Measure order density

KPI: orders / PG

# 10 90-Day Pilot-to-Scale Plan validate → pilot → decide

## Pilot KPI framework

# 11 Scale Decision & Final Thesis

evidence over calendar

Scale gate: five questions at Day 90

## Product-market fit

- Do customers like the taste?
- Do they use it repeatedly?
- Is preparation genuinely convenient?

**Evidence:** Taste acceptance · reliable prep · low complaints

## Commercial fit

- Will customers pay ₹149?
- Does bundling improve retention?
- What is CAC?

**Evidence:** Repeat purchase · frequency · willingness to pay

## Distribution fit

- Do PGs generate concentrated orders?
- Does pickup improve economics?
- What is delivery cost?

**Evidence:** Meaningful PG density · manageable delivery

## Operational fit

- Is production consistent?
- Is shelf life validated?
- Can capacity scale without quality loss?

**Evidence:** Consistent quality · validated shelf life · manageable stock

## Economic fit

- Is contribution positive after variable costs?
- Does repeat reduce acquisition burden?

**Evidence:** Contribution stays healthy after relevant variable costs

## Day 90 decision

### ✓ Scale

All five fits met: widen PG clusters, evaluate the second SKU and quick-commerce.

### ↻ Iterate

Mixed evidence: fix the weakest fit (taste, price or delivery) and re-test in the same clusters.

### ✗ Rethink

Core fit missing: revisit segment, price or format before spending more.

## STRATEGIC THESIS

A hyperlocal convenience-breakfast business, not a broad “millet brand”: *self-cooked without the usual work of self-cooking.*

## THE INITIAL STRATEGY AT A GLANCE

Kharghar

College students in PGs

Young professionals (secondary)

1 hero SKU

₹149 / 5 servings

≤10-min target

Experiential sampling

Breakfast Week

PG bulk

Pickup points

Selective delivery

Quick-commerce: future / fallback

90-day validation

Scale on evidence

## What must be proven

- Taste acceptance
- Repeat purchase
- Willingness to pay ₹149
- CAC
- Delivery economics
- PG density
- Operational reliability

## Immediate next actions

- Finalise the millet upma prototype
- Run timed prep and utensil tests
- Start shelf-life validation pathway
- Map PG clusters near colleges in Kharghar
- Set up the family-operated pickup point
- Run the first sampling round and test ₹149

## Assumptions register

none of these is a validated fact

### Assumption

### Status

### Validation method

≤10-minute preparation

Hypothesis

Timed product test

1-2 utensils

Hypothesis

User test

45-60 day shelf life

Target

Food / packaging validation

2-4 purchases / month

Hypothesis

Repeat tracking

Kharghar PG density

Hypothesis

Field mapping

₹149 willingness to pay

Hypothesis

Purchase / conversion testing

Scale follows evidence, not the calendar: 90 days is a test window, not a growth target.
